Abstract: Objective To investigate the efficacy of Yiqi Fumai Lyophilized Injection (YQFM) combined with sacubitril/valsartan in the treatment of chronic heart failure and the effects on high-sensitivity troponin (hs-cTnT), N-terminal pro brain natriuretic peptide (NT-proBNP) and left ventricular function in patients with chronic heart failure. **Methods** A total of 200 patients with chronic heart failure admitted to the Fifth People's Hospital of Dongying City from January 2020 to December 2022 were selected as the research objects. According to the different treatment schemes of patients, they were divided into the control group and the experimental group, with 100 cases in each group. On the basis of routine treatment, patients in the control group were treated with Sacubitril Valsartan Sodium Tablets, which was taken twice a day on an empty stomach or with food, with an initial dose of 50 mg each time.

After that, the dosage was adjusted according to the patient's condition, with a maximum of 200 mg per day. On the basis of treatment in the control group, patients in the experimental group received a combination of YQFM, and 5.2 g of YQFM was added to 250 mL of Glucose Injection, intravenous drip once a day. Both groups received treatment lasting for two weeks. The therapeutic effects of the two groups were counted and compared. Serum hs-cTnT, NT-proBNP and transforming growth factor β 1 (TGF- β 1) were measured before and after treatment. Horizontal echocardiography was performed before and after treatment to measure the left ventricular end systolic diameter (LVESD), left ventricular end diastolic diameter (LVEDD), LVEF, and left ventricular short axis shortening rate (FS) of the patients. The incidence of adverse reactions such as hypotension, rash, hyperkalemia and angioedema in the two groups were observed during the treatment. **Results** The total effective rate of the experimental group was 98.00%, significantly higher than the 88.00% of the control group ($P < 0.05$). Before treatment, the serum hs-cTnT, NT-proBNP, and TGF- β 1 levels of patients in both groups were measured and there were no statistically significant difference in level comparison between two groups ($P > 0.05$). After treatment, the serum levels of hs-cTnT, NT-proBNP, and TGF- β 1 in both groups of patients were significantly lower than before treatment in the same group, and the levels of all indicators in the experimental group were significantly lower than those in the control group ($P < 0.05$). Before treatment, there was no statistically significant difference in left ventricular function indicators LVESD, LVEDD, LVEF, and FS between the two groups of patients ($P > 0.05$). After treatment, LVESD and LVEDD in both groups of patients were significantly reduced compared to before treatment in the same group ($P < 0.05$), while LVEF and FS were significantly increased compared to before treatment in same group ($P < 0.05$), and the improvement degree of all indicators in the experimental group was better than that in the control group ($P < 0.05$). There were three cases of adverse reactions in the experimental group, with a total incidence rate of 3.00%, significantly lower than the 15.00% in the control group ($P < 0.05$). **Conclusion** YQFM combined with sakubatrox valsartan can improve left ventricular function and reduce myocardial damage in patients with chronic heart failure. On the other hand, it can reduce the levels of hs-cTnT and NT-ProBNP, reduce adverse drug reaction, and enhance clinical efficacy.

在临幊上,慢性心力衰竭是一种常见心血管疾病,也是心脏疾病的终末期,主要症状为呼吸困难、下肢水肿等,易造成恶性心律失常、心源性猝死,严重威胁患者的生命安全。对于慢性心力衰竭患者的治疗,既要在短期内缓解症状,又要延缓心肌重构,避免疾病恶化^[1]。沙库巴曲缬沙坦是目前治疗此类疾病的常用药,具有利尿、扩张血管、降血压等作用,但部分患者治疗后仍未达到理想效果,而且停药后易复发,整体疗效不佳。注射用益气复脉(冻干)是一种新型药,具有生津养阴、益气复脉、增加心肌代谢的作用,多用于慢性心力衰竭合并冠心病的治疗中^[2-3]。本研究选取200例慢性心力衰竭患者为研究对象,探讨注射用益气复脉(冻干)联合沙库巴曲缬沙坦的治疗效果,为临幊更高效合理用药提供参考。

3 讨论

慢性心力衰竭是中老年人常见病,病情迁延不愈,需要长时间住院治疗,对患者生活质量、生命安全的影响极大。研究表明^[6-7],心功能不全和多个系统激活关系紧密,如肾素-血管紧张素-交感神经系统等,通过对这些系统的激活,使患者心功能发生变化,从而加重心肌功能受损,加速心功能恶化。另外,随着左心室的充盈扩大,逆向传至肺静脉,导致肺静脉回流异常、肺小动脉收缩,继而影响患者的心肺功能^[8-9]。目前,临床多采用β受体阻滞剂、血管扩张剂等药物治疗慢性心力衰竭,常见如沙库巴曲缬沙坦,其是沙库巴曲和缬沙坦的复合制剂,前者为脑啡肽酶抑制剂,可升高脑钠肽水平,对抗交感神经激活产生的副作用,用药后可快速达到峰值,具有药物见效快、生物利用度高的特点;后者是降压药,可阻断血管紧张素II受体,降低血压水平,同时还能逆转高血压引发的左心室肥厚,改善患者的远期预后^[10-11]。有报告显示,虽然此类药物效果显著,但单独使用易引发低血压、血管性水肿等不良反应,影响治疗效果^[12]。

在中医领域,慢性心力衰竭属于“心悸”范畴,

由过度疲劳、外邪入侵等导致心脏受损,故以温阳通肺、活血益气作为治疗原则。注射用益气复脉(冻干)是一种中药制剂,由五味子、红参、麦冬组成^[13],其中红参可滋补元气,麦冬可生津养阴、止渴,五味子可收敛心气,诸药联用共奏益气、生津之功效。现代药理研究表明,红参可增强心肌收缩力,强化机体耐缺氧能力,从而促进心肌细胞RNA、DNA合成;麦冬可修复受损心肌细胞,改善心功能^[14]。注射用益气复脉(冻干)和沙库巴曲缬沙坦联合使用可获得理想的治疗效果。

本研究以200例慢性心力衰竭患者为对象,结果表明试验组治疗总有效率高于对照组,且不良反应发生率低于对照组($P<0.05$)。在血清指标水平、左心室功能指标方面,试验组的改善作用同样优于对照组($P<0.05$),提示注射用益气复脉(冻干)联合沙库巴曲缬沙坦治疗可有效改善慢性心力衰竭患者症状、血清指标与心功能指标,且能够减少药物不良反应的发生,从而提高治疗效果,促进患者早日康复^[15]。现代药理研究表明,注射用益气复脉(冻干)可抑制交感神经,降低血液中的hs-cTnT、NT-proBNP浓度,同时提高患者心脏顺应性,增强心脏泵功能,从而增加左心室舒张末期面积,改善患者心功能,和沙库巴曲缬沙坦联用可发挥药物协同作用,实现标本兼治的目的^[16-17]。此外,沙库巴曲缬沙坦长期使用会引发高钾血症、低血压等不良反应,而注射用益气复脉(冻干)不良反应少,少数可能出现轻微发热、皮疹等。研究^[18]表明,注射用益气复脉(冻干)治疗慢性心力衰竭伴低血压效果理想,患者血压水平升高,心功能改善。方剂中五味子和红参中含有皂苷,能够对钙离子通道起到拮抗作用,并具有抵抗自由基的作用,促进患者血流改变,促使冠脉血管扩张,利于减少外周阻力,增加血流量,对血压进行有效调节,且不会增加心率^[19]。

本研究结果表明,对慢性心力衰竭患者进行注射用益气复脉(冻干)和沙库巴曲缬沙坦联合治疗,

一方面可改善患者左心室功能,降低心肌受损;另一方面可降低hs-cTnT、NT-ProBNP水平,减少药物不良反应,增强临床疗效,值得推广。
