The model group, the high, medium and low dose of metoprolol tartrate (0.60, 0.30, 0.15 mg/kg) group were set up, another 10 rats were taken as control group. Corresponding drugs was ig administered once a day for four weeks, distilled water was ig administered in model group and control group. The physiological activities of rats were observed and recorded, HE staining was used to observe the changes of arterial lumen surface. TGF-β, Smad2, Smad3 mRNA detected by real time PCR, and TGF-β, Smad2, Smad3 protein level analyzed by western blotting. **Results** Compared with control group, rats in model group ate less, had lighter body weight, mental retardation, disordered hair, no luster and less activity; compared with model group, the physiological state of the rats in the metoprolol tartrate group improved. HE staining showed that the elastic plates in the aortic wall of the control group were arranged regularly and tightly in a wavy membrane shape; the elastic plates in the aneurysm wall of the model group were straight and fractured; compared with the model group, the elastic plates in the metoprolol tartrate group were less fractured and the arterial wall was wavy membrane shape. Compared with the control group, the expression levels of TGF-β, Smad2 and Smad3 in model group were significantly increased ( $P < 0.05$ ); compared with model group, the expression levels of TGF-β, Smad2 and Smad3 in the metoprolol tartrate group were significantly decreased ( $P < 0.05$ ), and there was a dose-dependent relationship. **Conclusion** metoprolol regulated TGF-β/Smad signal pathway suppressed

thoracic aortic aneurysms progression.

**Key words:** metoprolol tartrate; TGF- $\beta$ /Smad signal pathway; thoracic aortic aneurysms

动脉瘤是影响主动脉的第二大最常见疾病,据统计,全球每年每10万人中就有2.6例动脉瘤破裂死亡<sup>[1]</sup>。主动脉生长通常是进行性的,没有直接的药物治疗。当主动脉瘤导致的风险大于手术风险时进行手术切除,预防性手术切除用于预防长期并发症,如破裂或剥离<sup>[2]</sup>。采用非侵入性药物治疗预防主动脉进一步生长可减轻手术负担,预防急性主动脉并发症<sup>[3]</sup>。据报道,在过去几十年里,胸主动脉瘤(thoracic aortic aneurysm, TAA)的发病率一直呈上升趋势<sup>[4]</sup>。TAA的发生与年龄、性别无关,是由多种原因导致的主动脉壁结构破坏、强度减弱,发生瘤样扩张或膨出的高危性疾病<sup>[5-6]</sup>。TAA大多是遗传的,许多基因突变导致TAA的发生,如FBN、ACTA、MYH、MYLK、TGFB2、TGFB3、TGFB1、TGFB2、Smad3、Smad4等<sup>[7-15]</sup>。尽管外科手术及非侵入性药物治疗提高了TAA患者的存活率,但是对TAA作用的分子机制的研究尚未完全清楚。

转化生长因子- $\beta$ (TGF- $\beta$ )/Smad信号通路由TGF- $\beta$ 家族、TGF- $\beta$ 受体及受体底物Smad蛋白家族组成,TGF- $\beta$ 在细胞增殖、凋亡、上皮间质转化、转移及侵袭等过程中发挥重要作用,具有TGF- $\beta$ I及TGF- $\beta$ II两种细胞表面受体,主要参与TGF- $\beta$ 信号的转运<sup>[16-20]</sup>。经典的信号通路,TGF- $\beta$ 与TGF- $\beta$ II结合并将其磷酸化,再激活TGF- $\beta$ I,完成信号的跨膜转导,进一步激活下游Smad2/3并进行磷酸化,再与Smad4结合,并向细胞核内转移,作为转录因子调控靶基因的翻译,完成信号转导<sup>[21-23]</sup>。据报道,TGF- $\beta$ /Smad信号通路相关基因发生突变导致TAA相关的多种综合征的发生,如马凡氏综合征(MFS)、洛伊迪兹综合征(LDS)、动脉瘤骨关节炎综合征(AOS)和幼年性息肉病综合征(JPS)<sup>[24]</sup>等。

本研究通过构建TAA大鼠模型,采用酒石酸美托洛尔进行治疗,观察酒石酸美托洛尔是否通过调控TGF- $\beta$ /Smad信号通路调节小鼠TAA的发生及转移。

是一种高危疾病,在发生致命性破裂或夹层前无明显的病征。目前遗传相关型TAA和家族型TAA都已经找到明确的基因缺陷位点,比如马凡氏综合征FBN1基因突变<sup>[26-27]</sup>、洛伊迪兹综合征TGFβR1和TGFβR2基因突变<sup>[27]</sup>,IV型埃莱尔-当洛综合征中COL3A1基因突变<sup>[28]</sup>,家族型TAA的ACTA2、

MYH11及TGFβR2基因突变<sup>[27-29]</sup>等。酒石酸美托洛尔是美托洛尔的一种新剂型,是一种选择性的β1受体阻滞剂,广泛用于高血压、心绞痛、伴有左心室收缩功能异常的症状稳定的慢性心力衰竭等<sup>[30-32]</sup>。本研究通过构建TAA大鼠模型,使用高、中、低3剂量酒石酸美托洛尔治疗,结果显示,酒石酸美托洛尔

治疗后 TAA 大鼠生理活动明显得到改善,且 TGF- $\beta$ 、Smad2、Smad3 的表达水平明显下调。

TGF- $\beta$ 1 是具有调节细胞外基质代谢及炎性反应的重要多功能性细胞因子,在包括硬皮病等结缔组织疾病、肺气肿、乳腺癌及一些先天性的血管疾病中均检测出异常<sup>[33]</sup>,TGF- $\beta$ 1 在细胞外基质代谢的调节中有不可或缺的作用,TGF- $\beta$ 信号转导异常则可能导致多种疾病的发生,如胚胎发育异常、肿瘤、组织纤维化、心血管疾病和免疫疾病等<sup>[34-36]</sup>。TGF- $\beta$ /Smad 信号通路与动脉粥样硬化等多种器官硬化及纤维化等密切相关,TGF- $\beta$ 1 是细胞的重要因子之一,有 6 种不同的亚型,在体内分布广泛,具有多功能、多向调节生长等作用,能够促进细胞外基质(ECM)的生成,即通过促进胶原纤维、纤黏连蛋白、层黏连蛋白等合成,同时抑制基质降解酶的活性,减少 ECM 降解<sup>[37]</sup>。Smad 是 TGF- $\beta$ 1 下游的信号转导分子且为重要靶点,分为受体调节型、通用型及抑制型,受体调节型可直接与活化的 I 型受体结合而磷酸化,如 Smad1、Smad2、Smad3、Smad5、Smad8,通用型如 Smad4,抑制性如 Smad6、Smad7<sup>[38-39]</sup>。近年来,在主动脉瘤相关性疾病的研究中发现,如家族性动脉瘤、马凡氏综合征、洛伊迪兹综合征等患者中<sup>[9,27]</sup>,TGF- $\beta$ 1 的表达水平显著上调,TGF- $\beta$ 1 通过上调结缔组织生长因子(CTGF)引起中动脉壁组织胶原增生及透明样物质增生<sup>[40]</sup>。本研究发现,使用酒石酸美托洛尔治疗 TAA 模型大鼠,大鼠的生理状态等较模型组发生明显的改变,进一步对瘤体组织中 TGF- $\beta$ 、Smad2、Smad3 的表达水平进行检测,结果显示 TGF- $\beta$  及下游 Smad2、Smad3 的表达水平显著低于模型组。

本研究表明酒石酸美托洛尔改善 TAA 大鼠的生理状态,并揭示其分子机制与调节 TGF- $\beta$ /Smad 信号通路相关,为临床治疗 TAA 提供参考依据。
